## MINORITY UROLOGIC HEALTH 4 KEY CONCERNS

Among minority races and ethnicities, there are four key areas of urologic health concern, which tend to see higher rates of disease for these populations.

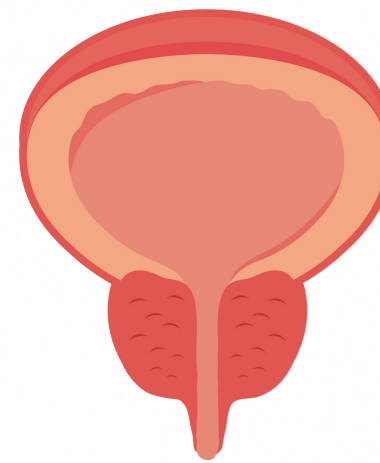

Women are 50% more likely than men to develop a **urinary tract infection (UTI)**.

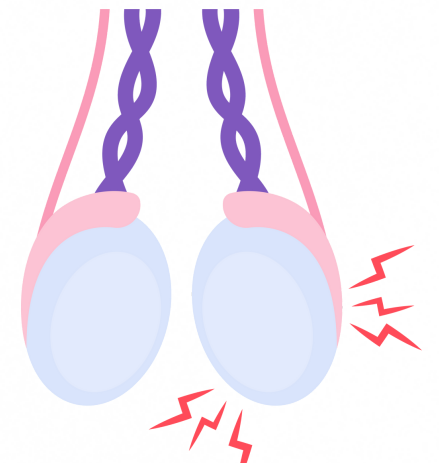

American Indian women may have the highest UTI prevalence than any other race or ethnicity.

**Kidney disease** rates are highest among the African American population. This group is at an increased risk of **kidney failure** than other races or ethnicities.

African American men are nearly 75% more likely to develop **prostate cancer** than any other race/ethnicity, and are 2X as likely to die from the disease.

White men are 5X likelier to develop **testicular cancer** than African American men, but the overall testicular cancer survival rate among this population is lowest among all races.
